- The Pfizer and Moderna vaccines require 2 doses to

unt 2 weeks after the final dose.

- Booster doses provide additional protection against getting a booster shot when you are eligible.

• The vaccines may result in mild side effects, such as pain at the injection site and feeling tired, which are normal and expected with vaccination.

Yes, the vaccines are safe for patients with these health conditions and for dialysis patients like you. Because your body is less capable of building immunity, we recommend

COVID-19 vaccines continue to reduce your risk of severe illness, hospitalization, and death due to severe COVID-19 infection, including variants.

By combining vaccinations with practices like masking and social distancing, we can protect ourselves and others from getting sick and reduce the chance that other variants emerge.

While we don't know exactly how long COVID-19 vaccine protection lasts, we know that protection can decrease over time. This is why we recommend staying up-to-date with your COVID-19 vaccinations to keep your immunity against COVID-19 strong.

additional protection against the recent Omicron variants of COVID-19. An updated booster will help your immune system fight off a wider variety of variants.

No, you are allowed to "mix and match" vaccine type.

receive as a booster, even if it is different than why

While we strongly recommend getting vaccinated, you can also receive a booster, even if it is different than why you received your previous dose.

Yes, you are allowed to "mix and match" vaccine type.
